

Release Notes

225

We've worked hard for you...

Product Functionality

Additional level of smartlist criteria

It is now possible to set up smart list criteria up to 4 levels in addition to the base level. Time to level up!

Restriction of CNI list possibilities to child items

Added option to restrict the possible child item lists when creating a new item, so that you only see relevant lists. Confusion be gone!

Multi-level filtering

Now additional filters can be applied to any level of multi-level (hierarchical) smartlists. Each filter row corresponds to a hierarchy level. Filtering never felt so good...

Multiple children on lowest level of smartlist criteria

It is now possible to select multiple lists per smartlist criteria level. Once multiple lists are selected, the level automatically becomes the lowest level. Enter the world of multiple children...

IMPROVED

Extended subject of itemmail template

The message title length of the item mail template and alert type, are increased to allow more than 40 characters input. Freedom!

Consideration of hidden workspaces when defining smartlist criteria

Now, when defining smart list criteria, you can also select lists from hidden workspaces. Remember hide and seek?

Unique code for every action button

It is now possible to provide a unique code for action buttons. This helps to easily identify the correct action in API and during export/import. When provided, the code is unique per list. It's like a fingerprint for your buttons.

Export/Import: Location settings on list custom fields

Export/Import contains the list settings of location fields:

- *Enable drag & drop*
- *Retrieve current location*

Satellite layer as default on NokiaHERE maps

You now have the 'Satellite' layer as default view for NokiaHERE maps. Hey, the CIA has it as well. We couldn't stay behind. ;-)

Description on indicator

Indicator summary is now visible on the indicator dashboard.

More advanced thumbnails of file attachments

The look and feel of attachments on item details is now completely revamped. It now presents a bigger image thumbnail. Also, the layout has been cleaned. Thumbnails up!

Smart list criteria multi-level enhancements

Now, a clear text is shown for adding levels. If a smartlist has extra levels, matching conditions are always set to 'Match all conditions'. Also, the current level on which you are setting the conditions is visually marked for your convenience.

Basic feedback for import

*A feedback message is shown when the configuration import is completed.
Now you know when you can check out your new pmX environment!*

No prefix when adding url with a protocol (://)

No protocol is prefixed when you add a URL attachment. You can use your own protocol if you want. Exotic!

Import/Export: All standard fields smartlist criteria

All standard fields and their values used as smartlist criteria, are now included in the export/import. Now you don't have to spend time to manually enter these criteria anymore!

Assigned usergroups access right "Everyone"

New option '(Everyone)' has been added to 'Assigned usergroups'. When it is selected, every user has privileges as if he is the 'assigned to' user of the item. Also, when a usergroup is added to the workspace, it is automatically taken into account. Who needs Anonymous when you have Everyone?

Product Quality

Basic support for pmX scalability (farm)

It is now possible to run pmX on a Web Farm configuration. This means we can handle large volumes of concurrent users much better. We love farms...

Full Import logging

Now, the workspace import process is logged in details. A log is created during import of the configuration. It contains the information about all processed entities with their type and the status of the import. Trust is good, control is better.

IMPROVED

Selenium tests enabled to be run

Selenium libraries are now packaged during building a release, so that they can be used to write your automated test scenario's. Automation rocks!

Full implementation of cache objects in REDIS

All objects are now supported in REDIS. Inca can run on a separate server using the same application cache. Your indicators and batch operations will run much faster. Factors, not percentages...

Various performance fixes

We've made various performance improvements. The pmX engine now runs a lot smoother...

Automatically prefill DB cache when cleared

Added functionality that if a database goes offline, the start pages are reloaded when the database comes back online. This ensures a fast loaded dashboard. Fill up please.

RTF comparison performance enhancement

We greatly improved the speed of the difference calculation of rich text fields which are shown in the item history. Fasten your seat belts...

And many more improvements...

Next milestone, we focus on boosting the performance! Get ready for warp speed.
